# 1 Executive Summary

Team Mike is a startup initiative aimed at solving problems that come to light as society begins to adopt new technologies. One of which pertains to autonomous driving and “smart cars” as they are beginning to break into the automobile market more and more every year with examples such as Tesla and Ford. In a perfect world, if every driving car were to be a smart car with “autopilot,” then it would make sense for each of them to communicate cruise control data with each other to reduce traffic build-up and make traveling more efficient. Through rotational leadership on a monthly basis, each team member possesses a set of distinct skills that can translate to highly efficient work sessions. Aside from developing a traditional cruise control, the aim is to make the software open source as it will serve as the foundation to a more interconnected logistical future in which autonomous cars can fully achieve their potential within a growing technologically advanced society.

## 2 Introduction

The past century has seen an explosion of innovation on a scale never before seen in human history. The rapid development and refinement of a myriad of motor technologies catalyzed the innovation process by allowing ideas to transfer at rates never before seen. With the constraint of distance loosening thanks to every iteration of the automobile, people have been granted more freedom to do what they please. While the automobile has enhanced society in several ways, there are some glaring problems that need to be addressed to continue the current rate of human progress and innovation. One of the biggest problems is driver fatigue, which is responsible for approximately 72,000 crashes annually. Programming the automobile to be reliably autonomous to a degree is one way to circumvent the issue of driver fatigue and making roads safer. That's exactly what cruise control aims to do. By moderating the speed of the vehicle by itself, cruise controls aim to lessen the effects of driver fatigue on the road. However, the technology is not perfect, and Team Mike aims to resolve that by creating the perfect cruise control system.

When it was implemented in 1958, cruise control was suitable for that era, however, as technology continually improves, the embedded software must as well. For longer car trips, it does not make sense for users to constantly accelerate and decelerate for several miles; this is where cruise control comes in. By being able to set the speed, the user is now able to accurately set and maintain the speed they wish to without having to constantly intervene which, over time, would cause less harm to the vehicle as variable speed and RPMs are not as desirable as that of near-constant.

Our group intends to use an Agile method to implement our version of cruise control. This would encourage code sprints in two-week lengths where work will be divided into smaller sections and distributed based on each members' strengths. The Agile method may vary as to which one we specifically choose but regardless, this project will not come to fruition using Waterfall or other methods. The way that we are going to organize our group is through weekly meetings and ensuring that everyone knows their tasks for the week. These weekly meetings can also serve as a place where team members mention any obstacles that have come in their way when trying to resolve a problem, and also serve as a time where the team as a collective can try to think of solutions around those obstacles. We also plan on giving real-time updates about any progress made through Slack in order to ensure all members of the team are equipped with the most recent developments of the project. We also intend on using Java to implement our cruise control

system. We believe that the high-performance Java provides and the fact that its part of the Object-Oriented Programming (OOP) paradigm makes it perfect for embedded systems.

There are a plethora of features that make up cruise control. As most cruise controls are seen on vehicles, there are generally a few buttons: increase speed (and sometimes decrease speed) and the button that starts cruise control. Once cruise control is set, the user then has the ability to increase, decrease, or maintain the speed of a vehicle. Furthermore, if the user presses on the brake, then cruise control is automatically deactivated. The system also allows for the operator of a vehicle to manually deactivate it.

To successfully implement the features of maintaining a steady speed and a safe distance away from other cars, there are certain requirements to fulfill. At a high level, proper hardware with fast, reliable sensors is critical for this project. Furthermore, lives are fundamentally dependent on this product and therefore it requires software that is error-resistant and thus a strong development and QA (quality assurance) team. In addition, the software must also perform its expected tasks of moderating speed, maintaining a safe distance and switching back control to the driver when prompted to quickly. Having a cruise control software that is slow would be ineffective, so speed and accuracy are critical requirements for the software as well as the hardware. This is a mission-critical system because if it were to fail, it would put the lives of people in danger.

## 3 Requirements

### 3.1 Input

1. The system shall accept electric power from the alternator.
2. The power button that allows for the state of the system to change from on to off or vice versa.
3. When pressed, a button will either accelerate or decelerate in 1 mph increments.
4. When the brake is pressed, the cruise control system will unset the speed and give control back to the user until the user specifies a new speed to be set.
5. If the entire car turns off, then a signal will be sent to turn off the cruise control system.
6. RPM (Rotations Per Minute) sensor should be connected to the front axle and able to take readings for accurate speed calculations.
7. Engine sensor must be able to take input from the engine to tell the cruise control system to turn on or off.
  - (a) If the engine is turned on, the cruise control system must be ready for use within 3 seconds of the engine being turned on.
8. If the gas pedal is pressed, the vehicle will continue to accelerate at the control of the user, but when the gas pedal is released the cruise control system will continue to the previously set speed.

### 3.2 Output

1. Keep a log of activity in the system files to help debug in the event of a malfunction.
2. For every speed increase made by the user in the cruise control system, a visual indication by the software is necessary. This is so that the user minimizes their own human error. So, every time you increase the speed, you can see the cruise control speed on the car menu increasing by however much the user wants it to.
3. The system displays successful activation or deactivation in 10 milliseconds.

- (a) Numbers are subject to change depending on how inputs are received from surrounding system, but are expected to be in around that same ballpark.
- 4. Keep a log of every time the cruise control system is used and at what speed written to the system files.
- 5. Once the cruise control system is turned on, it must be readily available. The engine sensor must be able to understand that the engine is on and tell the cruise control system that, if the user so wishes, it must activate.
- 6. With all the inputs it is taking from all the sensors, the software must be able to deliver the desired output for each function in less than 15 milliseconds.
  - (a) The brake pedal sensor must be able to tell the software that the user has stopped, and stop the cruise control system. \*Numbers are subject to change depending on how inputs are received from surrounding system, but are expected to be in around that same ballpark.\*

### 3.3 Functional

- 1. The system shall accept direct current from the car battery to support logging after engine shut down.
- 2. The system shall receive the time and date from the car's clock every second.
- 3. A physical will be provided by the system for technicians to access the unit.
- 4. Hardware shall have a 4 nine (99.99%) availability.
- 5. Software shall have a 5 nine (99.999%) availability.
- 6. While the cruise control system is on and a speed is set, it must be able to increase and decrease the speed by 1 mph.
- 7. Able to switch the cruise control system on or off provided the engine is on.

8. Interpret engine on and off signal to allow for the cruise control system to be turned on within 3 seconds of received the signal.
9. Only allow the cruise control system to be activated when at a minimum speed of 25 mph.
  - (a) If the speed is set to 25 mph, the user cannot decrease the speed below 25 mph.
10. Maximum speed that cruise control system can be set to is at 125 mph.
11. While the cruise control system is on, if a user is driving at a speed of at least 25 mph and decides to set the speed, the cruise control system will maintain that speed.
12. If the user presses and continues to press the brakes, the user will not be able to set the speed.
13. If the user presses and continues to press the gas pedal, the user can set the current speed for the cruise control system, but it will immediately pause as stated in the input requirements then resume after the user releases the gas pedal.

### 3.4 Security

1. No external interface to reduce potential tampering. This applies to both the hardware such as sensors and the general cruise control system software. There would be no easy access to the cruise control system hardware or software so that the likelihood of someone being able to create issues is reduced substantially.
2. No Internet or Bluetooth connection. This is so that no bad actors can meddle with the car's system and hence, keeps the drivers safer as cyber security becomes more of an issue.
3. An administrator will need hardware to make changes to the mechanisms. The administrator must be authorized to make these changes and they must be a trusted third party or those who created the cruise control system themselves.

## 4 Requirements Analysis Model

### 4.1 UML Use Cases & Diagram

See Figure 1 for general use cases of cruise control system.

Figure 1: Sample UML diagram for cruise control system use cases.

It should be mentioned that there are two similar sounding states that need to be clarified:

- Activated
  - Granted the vehicle is on, the cruise control system is also now waiting for the speed to be set by the user.
- Set/Unset

- Given that the cruise control system has been **activated**, the user has requested for the speed to be maintained at its current speed.
- Given that the cruise control system has been **activated** and the cruise control system is in the **set** state, the user can either press the brake or press a button to unset the speed and revert back to the **activated** state.

1. Use Case 1:

Primary Actor: User

Description: User activates the cruise control system

Outcome: The cruise control system is now activated

Basic Flow:

- (a) Given that the vehicle is on, the user requests an activation of the cruise control system.
- (b) Cruise control system activates.
- (c) The cruise control system provides a visual feedback that it has been activated.

2. Use Case 2:

Primary Actor: User

Description: User sets the speed

Outcome: The speed of the cruise control System is set to a specific speed

Basic Flow:

- (a) Given that the vehicle is on and the cruise control system is in the activated state, the system requests values from sensors.
- (b) Sensors provide values for approval to set cruise control system at current speed.
- (c) Cruise control system requests the Engine Management System (EMS) set the speed at current position.
- (d) EMS Speed (Throttle) is set at current speed.
- (e) Cruise control system provides visual feedback to the user that the cruise control is set and working.

- (f) Sensors provide the changing environmental information to the cruise control unit (such as speed, request for increase/decrease speed, and brake).
- (g) Cruise control system detects the changes from the sensors and request adjusting speed or deactivating Cruise Control system accordingly.
- (h) Speed (Throttle) position is continuously set to new values to ensure that the speed remains constant.
- (i) Speed is continuously reported to the cruise control system.

3. Use Case 3:

Primary Actor: User

Description: User increases speed

Outcome: The speed of the Cruise Control System is increased

Basic Flow:

- (a) If the cruise control system is in the set state, the user requests an increase of cruise control system speed.
- (b) Cruise control system provides visual feedback that the system will alter the speed of the vehicle.
- (c) Cruise control system slowly increases the speed of the vehicle to match that of the request.
- (d) When the desired speed is reached, the cruise control system will provide visual feedback that the adjustment has been completed.

4. Use Case 4:

Primary Actor: User

Description: User decreases speed

Outcome: The speed of the Cruise Control System is decreased

Basic Flow:

- (a) If the cruise control system is in the set state, the user requests a decrease of cruise control system speed.
- (b) Cruise control system provides visual feedback that the system will alter the speed of the vehicle.
- (c) Cruise control system slowly decreases the speed of the vehicle to match that of the request.

- (d) When the desired speed is reached, the cruise control system will provide visual feedback that the adjustment has been completed.

5. Use Case 5:

Primary Actor: User

Description: User presses gas pedal while the cruise control system is set

Outcome: The speed of the vehicle increases while the gas remains pressed. When the gas is released, the speed will return to the speed of the Cruise Control System

Basic Flow:

- (a) If the cruise control system is in the set state, the user presses on the gas pedal.
- (b) In the event that the vehicle accelerates, the cruise control system will continually request the EMS to be set to the previously specified speed.
- (c) Speed will be continuously reported to the cruise control system.
- (d) After the user releases the gas pedal and the vehicle stops accelerating, the cruise control system will request for the EMS to be set to the previous specified speed.
- (e) The vehicle will naturally decelerate nearing the old set speed, and once reached, the cruise control system will resume with the set speed.

6. Use Case 6:

Primary Actor: User

Description: User applies brake while the cruise control system is set

Outcome: The speed of the vehicle decreases while the brake remains applied. When the brake is released, the speed will return to the speed of the Cruise Control System

Basic Flow:

- (a) If the cruise control system is in the set state, the user presses on the brake.
- (b) In the event that the vehicle decelerates, the cruise control system will continually request the EMS to be set to the previously specified speed.

- (c) Speed will be continuously reported to the cruise control system.
- (d) After the user releases the brake and the vehicle stops decelerating, the cruise control system will request for the EMS to be set to the previous specified speed.
- (e) The vehicle will naturally accelerate nearing the old set speed, and once reached, the cruise control system will resume with the set speed.

7. Use Case 7:

Primary Actor: User

Description: User deactivates cruise control system

Outcome: The Cruise Control System is now deactivated

Basic Flow:

- (a) If the cruise control system is activated, the user requests a deactivation of the cruise control system.
- (b) Cruise control system deactivates.
- (c) Cruise control system provides visual feedback that it has been deactivated.

8. Use Case 8:

Primary Actor: Administrator

Description: Administrator accesses logs of cruise control system

Outcome: The administrator is given access to the log of the Cruise Control System

Basic Flow:

- (a) With the vehicle turned on and the cruise control activated, an administrator will have to use a proprietary physical hardware key in order to gain root access.
- (b) Once access has been granted, the administrator can download the logs to an external storage device through a USB port.
- (c) Once downloaded, the administrator must log out using the same proprietary physical hardware key.

## 4.2 UML Class-Based Modeling

1. See Figure 2 for the class-based modeling for the cruise control system.

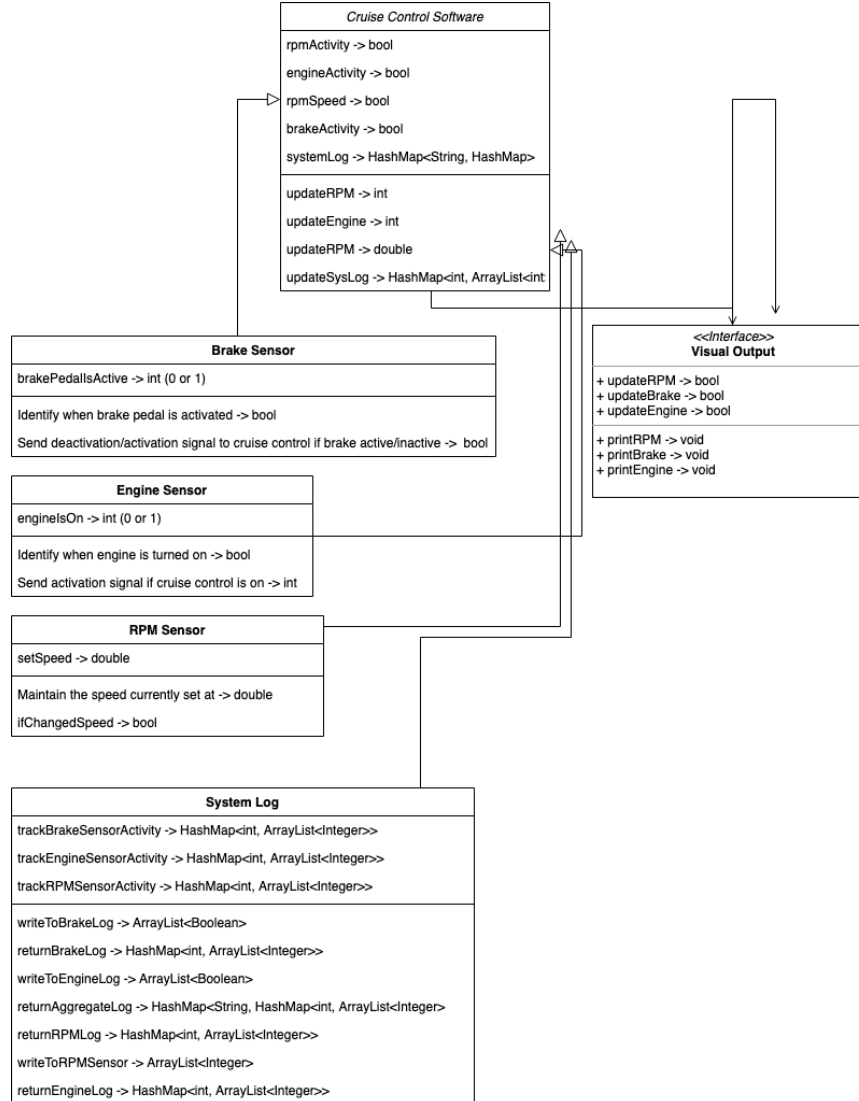

Figure 2: Sample UML class-based model for the cruise control system.

### 4.3 UML CRC Model Index Card

1. See Figure 3 for the CRC Model Index Cards for the cruise control system.

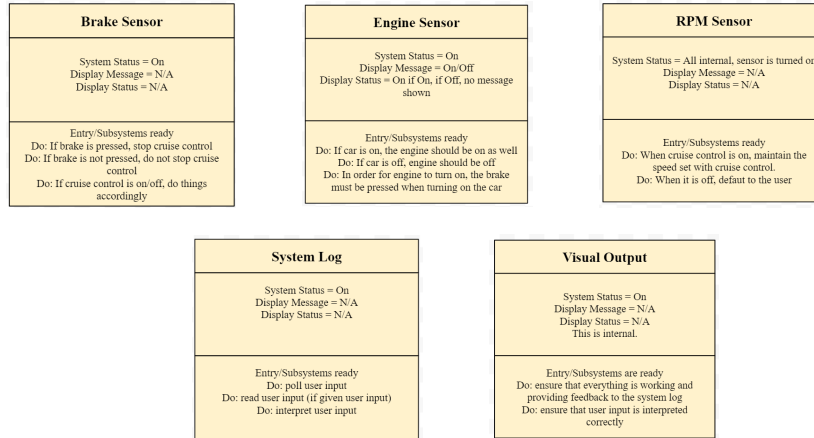

Figure 3: Sample UML CRC model index cards for the cruise control system.

### 4.4 UML Activity Diagram

1. See Figure 4 for the activity diagram of the cruise control system.

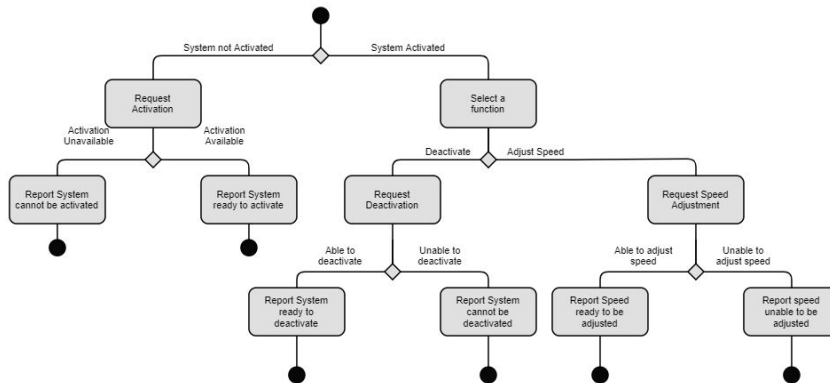

Figure 4: Sample UML activity diagram for the cruise control system.

## 4.5 UML Sequence Diagram

1. See Figure 5 for sequence diagram of the activation of the cruise control system.

Figure 5: Sequence UML diagram for activation of the cruise control system.

2. See Figure 6 for sequence diagram of cruise control system setting speed.

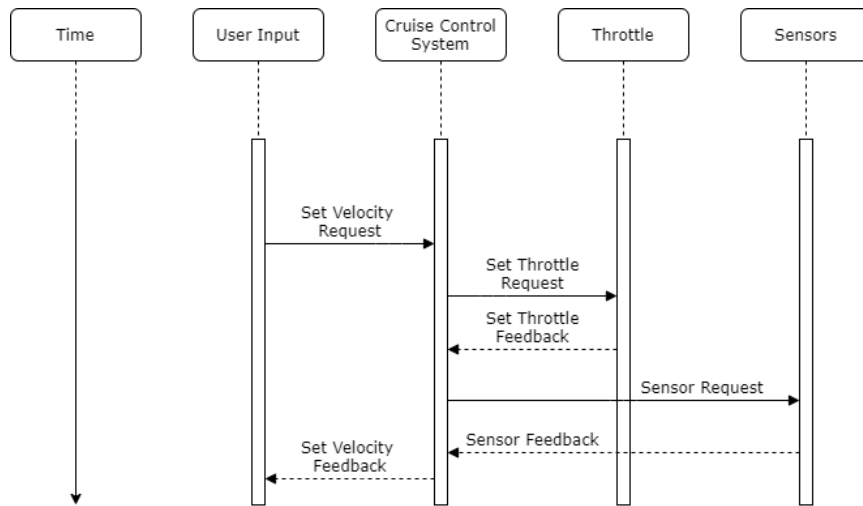

Figure 6: Sequence UML diagram for the cruise control system setting speed.

3. See Figure 7 for sequence diagram of cruise control system adjusting speed.

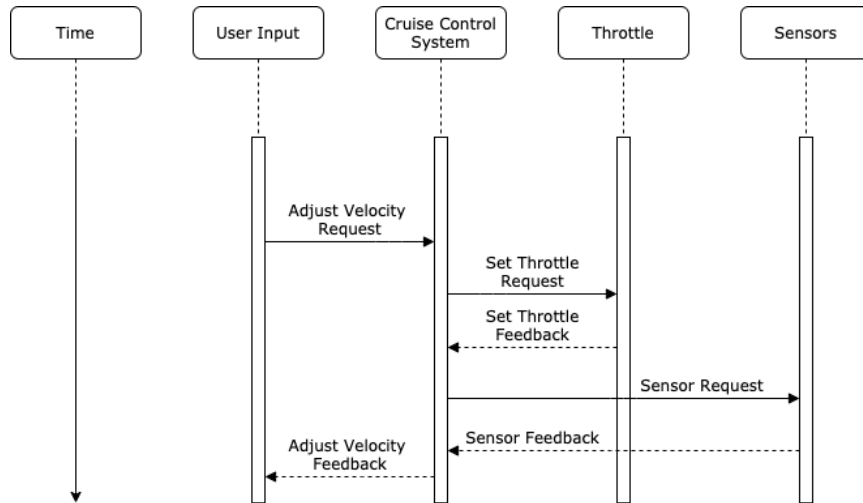

Figure 7: Sequence UML diagram for the cruise control system adjusting speed.

4. See Figure 8 for sequence diagram of the cruise control system being suspended when the user presses the gas pedal.

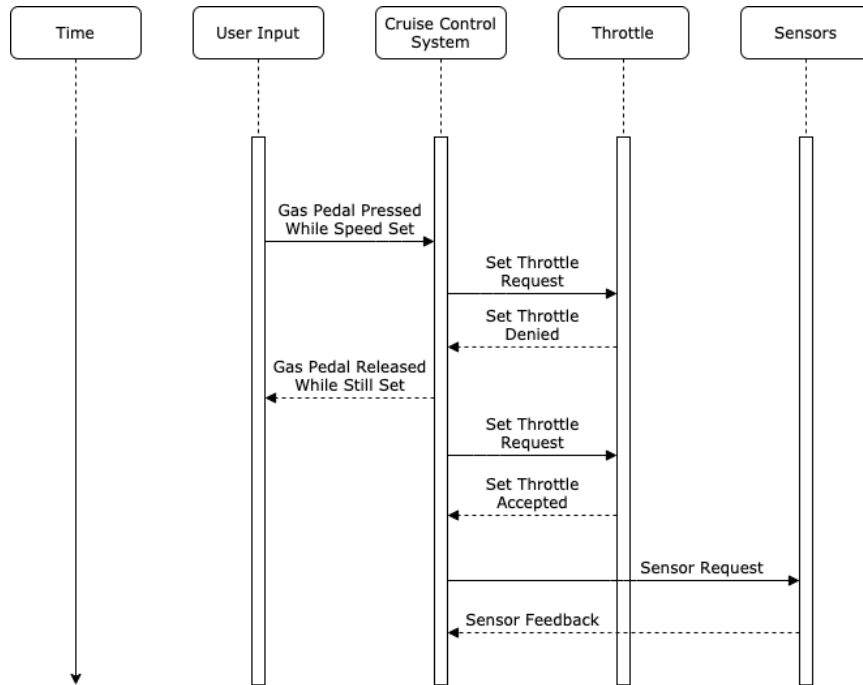

Figure 8: Sequence UML diagram for the cruise control system suspending during gas pedal being pressed.

5. See Figure 9 for sequence diagram of the cruise control system being deactivated.

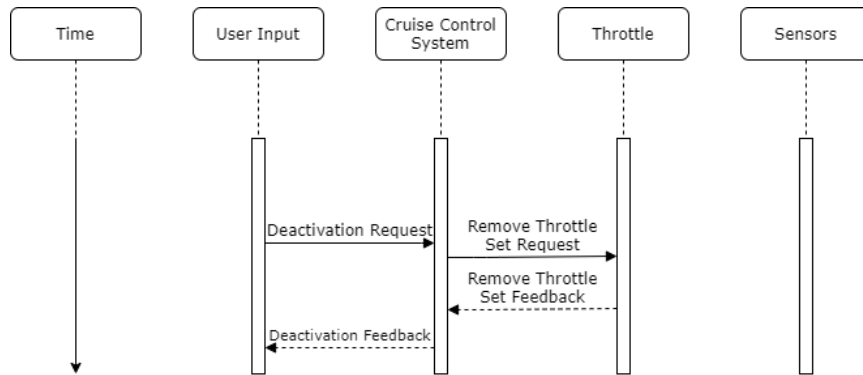

Figure 9: Sequence UML diagram for the cruise control system being deactivated.

6. See Figure 10 for sequence diagram of the administrator accessing the cruise control system logs.

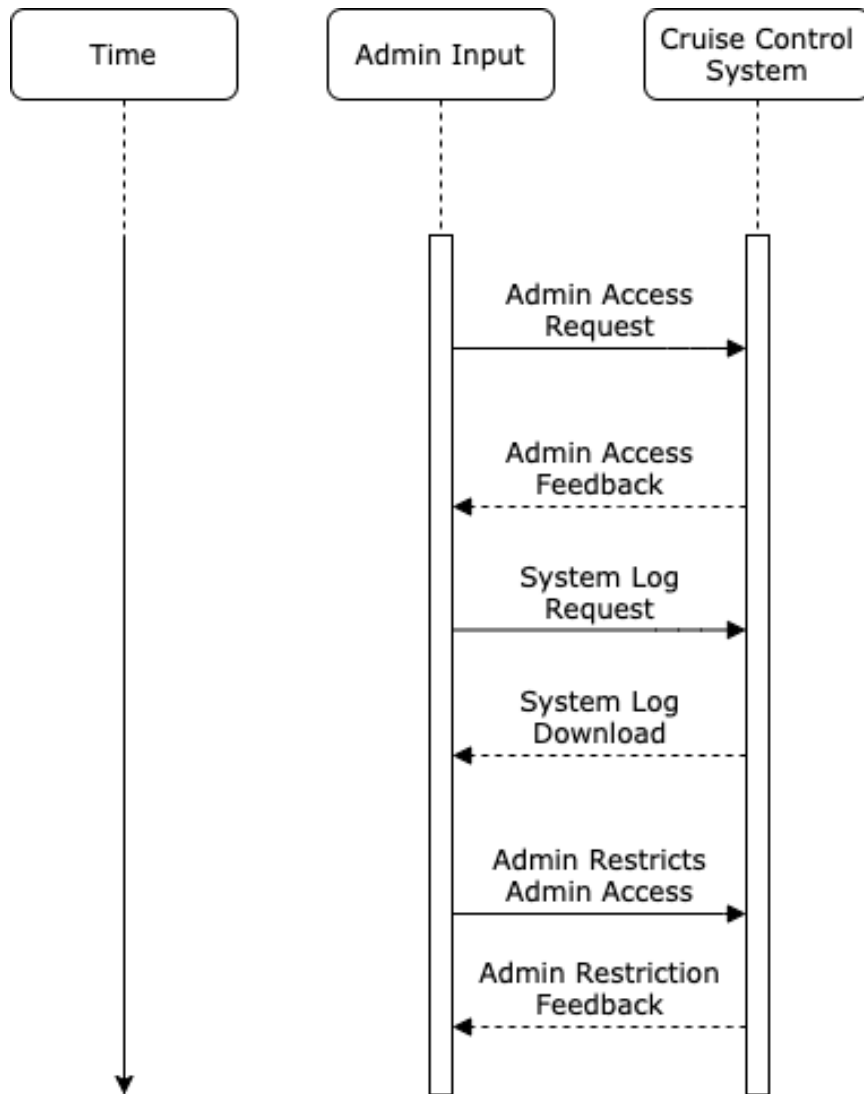

Figure 10: Sequence UML diagram for the administrator accessing cruise control system logs.

## 4.6 UML State Diagram

1. See Figure 11 for the state diagram of the cruise control system.

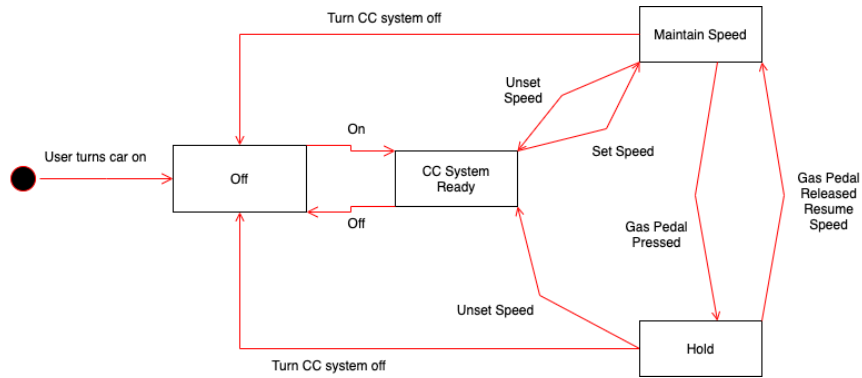

Figure 11: Sample UML state diagram for the cruise control system.

## 5 Software Architecture

### 5.1 Architecture Style

We decided to implement our Cruise Control System by using Object Oriented Programming.

1. We chose this architecture style because it will allow us to represent the different aspects of the cruise control system as different objects. For example, we will be able to represent the engine, the brake, the throttle, the sensors, and the log as different objects. These objects will have different attributes which will allow the program to closely resemble the real world. The brake object will contain a boolean that determines if the brake is being pressed or not. It will also have a function that will decrease the current speed of the vehicle. The sensors will have variables that determine if the current speed is less than, greater than, or equal to the desired cruising speed. The throttle will contain a boolean that determines if the user is trying to manually increase the speed of the vehicle. It will also have a function that will increase the speed of the car. The engine object will contain a boolean that determines if the vehicle is on or off. The log will be a tuple of a time stamp and a string. Whenever any action is taken by the driver or the cruise control system, it will be added to the log. All of these objects will be used as components of a larger Cruise Control System object.
2. Using object-oriented design will limit the number of programming languages that we would be able to use. Using object-oriented programming can result in more resources being used because the programs can become very large. It is also difficult to determine all of the classes that will be necessary in order to properly implement the Cruise Control System at the beginning of the project.
3. We also considered implementing our Cruise Control System with call and return architecture. This architecture design would have allowed us to split the main program into subprograms. It would have been easier to build upon the program by adding more subprograms. It would have also been able to set a hierarchy for different programs if we used the main program/subprogram style of this architecture.
4. We opted not to use a call and return architecture because this architectural design often does not adequately support the data structures

which would be important for the implementation of the Cruise Control System. Furthermore, due to a large number of subprograms, it may have become difficult to navigate and manage.

5. We did not consider the following architectures:

- (a) The components of a system encapsulate data and the operations that must be applied to manipulate the data. Communication and coordination between components are accomplished via message passing.
- (b) Pros: It models the real world very well. With OOP, programs are easy to understand and maintain. OOP offers code re-usability. Already created classes can be reused without having to write them again. OOP facilitates the quick development of programs where parallel development of classes is possible. With OOP, programs are easier to test, manage and debug.
- (c) Cons: With OOP, classes sometimes tend to be over-generalized. The relations among classes become superficial at times. The OOP design is tricky and requires appropriate knowledge. Also, one needs to do proper planning and design for OOP programming. To program with OOP, the programmer needs proper skills such as that of design, programming and thinking in terms of objects and classes etc.

## 5.2 Components

A software component is an architectural entity that encapsulates a subset of the system's functionality and/or data. A set of components will perform a function that is required by a system. This restricts access to that subset via an explicitly defined interface. The components of a software system are the following (but not limited to):

1. Network and Internet services
2. Hardware level of operating system
3. Logical level of operating system
4. Graphics engine
5. User interface
6. System services

## 7. Command shell

## 8. System utilities

Regarding cruise control specifically, the main component of our cruise control is the engine management system. In order to do this, the cruise control will receive data from the sensor components in which it relays data from the components of the car (take for example, the brake and the sensors).

Components and connectors are used to accomplish a system's goal. This is expressed through an architectural configuration. More precisely, an architectural configuration is an association between components and connectors of software architecture. A connector is not equivalent to a component as components provide application-specific functionality while connectors provide application-independent interaction mechanisms.

Connectors are between the sensors to deliver the data to the cruise control module. This processes the data to determine the speed of the car. The connectors between the cruise control and the engine management system will continually deliver this data to each other.

A software constraint defines how components can be integrated to form the system. A software constraint is a restriction on the degree of freedom you have in providing a solution. Constraints are effectively global requirements, such as limited development resources or a decision by senior management that restricts the way you develop a system.

The information that is shared between the sensor components to the signal that the engine has been started must be delivered very quickly before cruise control can be turned on. The activation and deactivation of cruise control must be done in a specific time constraint. These are all constraints of the system.

### 5.3 Control Management

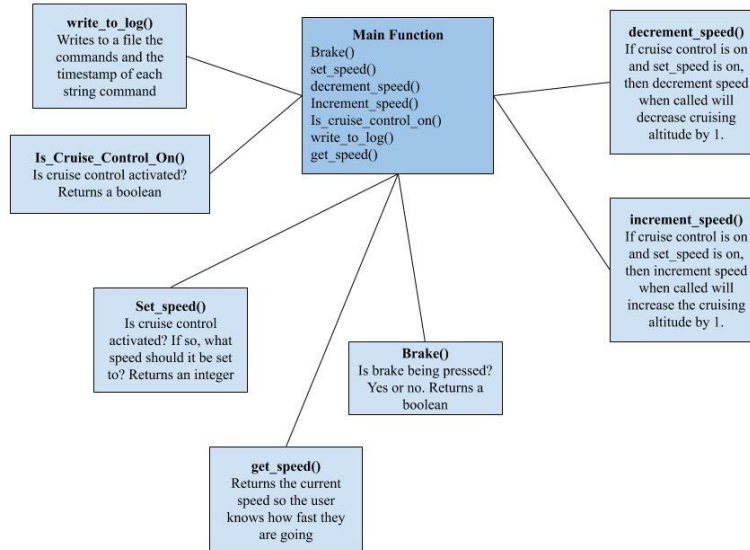

Figure 12: Control management diagram

We are going to have a main function that will have calls to the functions listed above as you can see: `write_to_log()`, `Is_Cruise_Control_On()`, `Set_speed()`, `get_speed()`, `Brake()`, `increment_speed()`, and `decrement_speed()`. These functions are essentially what are going to control our cruise control module. `Brake` will be a boolean as it is either true that the brake is being pressed or false if it is not being pressed. If cruise control is on and there is a set speed that is greater than 25 (which is the only way that cruise control can be activated in the first place), then if the brake function goes from false to true, then we shut off the cruise control entirely.

This is similarly listed out in the diagram as shown. All of our functions interact with our main function which is essentially the driver of our cruise control program.

### 5.4 Data Architecture

In terms of data architecture, considering that the project is going to be programmed in an object-oriented language such as Java, having the

data schema represented in the same programming paradigm streamlines the technical thought process behind the project. Having a data schema known for reliability is imperative for a mission-critical piece of software like cruise control.

Due to the use of Java, the general paradigm of the data architecture is object-oriented. Communication between the components is done via passing information as parameters to functional components such as methods and classes. Cruise control software requires information to be readily available to make critical decisions. An architecture based on passing information as parameters allows us to continually pass around data within the system, making data access trivially fast and facilitates quick decisions and computations that can mitigate the risk of fatal injury or things spiraling out of control.

To optimally implement this structure, we would need to define several functional components that each handles its own individual task and can be called as a function call to perform its individual task quickly. So, the cruise control system can have its own functional component for controlling the speed, controlling the brake, and sending visual and audio information to the user to inform about cruise control status such as whether it is on or off. The data components would always be available for use for functional components (such as program methods) in the cruise control software. This is because the functional components will need to repeatedly query the data components to accurately compute what speed is necessary, whether a brake is needed, and whether the user has requested for the system to turn on or off.

## 5.5 Architectural Designs

1. See Figure 13 for the architecture context diagram in which the external entities that the software interacts with are defined. Some include other systems, devices, and actors.

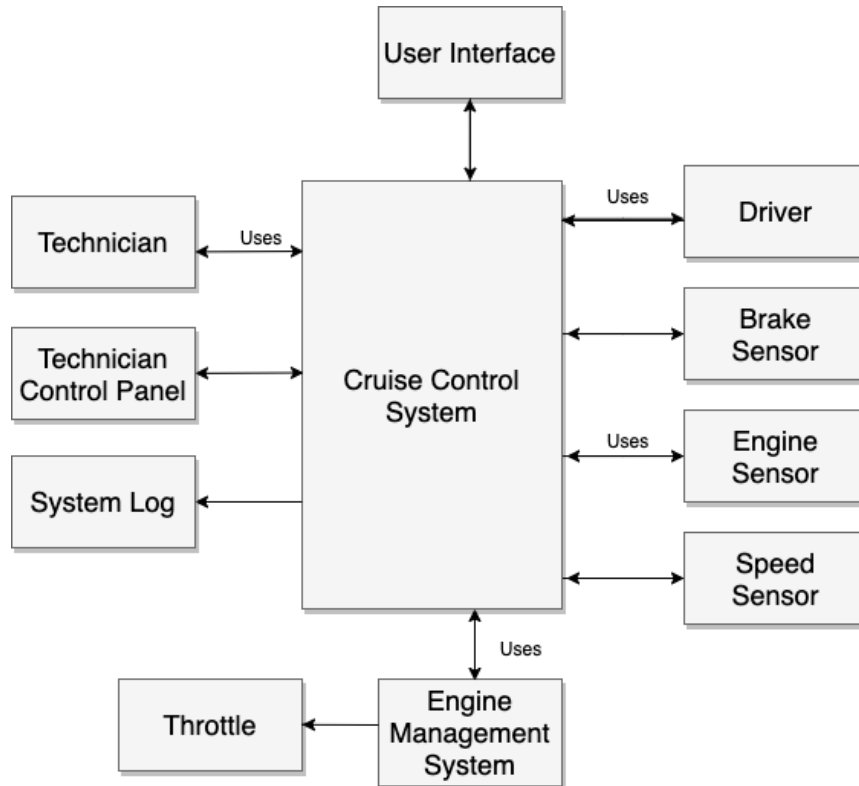

Figure 13: context diagram

2. See Figure 14 for the cruise control archetype. The archetype is an abstraction that represent an element of the cruise control system behavior.

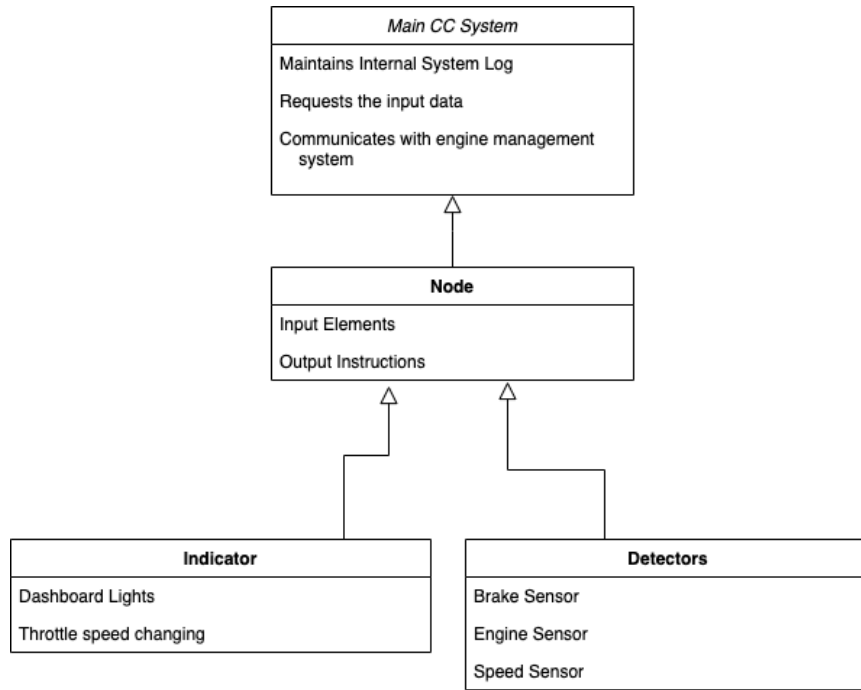

Figure 14: Cruise Control System Archetypes

- See Figure 15 for the cruise control top-Level component in which the archetype is further defined for help with implementation.

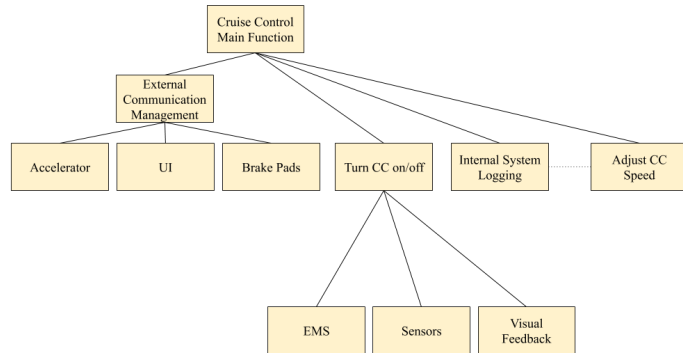

Figure 15: Top-level component

- See Figure 16 for the refined component architecture. This is a more refined version of the top-level component to help with implementation as well.

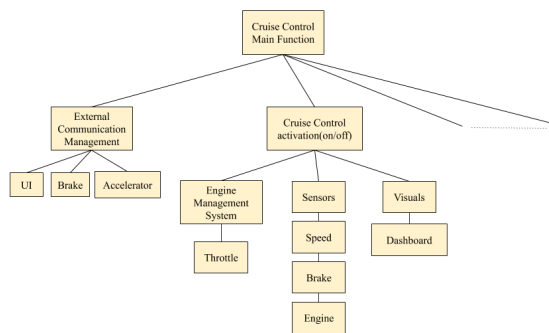

Figure 16: Refined component

## 5.6 Issues

1. Hamzah: The data architecture has not been thoroughly defined. Work through the data architecture and define how exactly the cruise control software will store the data using MongoDB in an object-oriented + call and return architecture. Review section 5.3. **Resolved: 4/17/2020**
2. Connie: work with Hamzah to identify how control interacts with the Data Architecture and the drawbacks of Object-Oriented design and call and return architectures. Review section 5.3. **Resolved: 4/17/2020**
3. Eric: Make security contingencies in case of data leak/ security issues. There needs to be a consideration of the ramifications that using a database like MongoDB can have security wise due to the fact that it is cloud based. Perhaps creating our own local database that behaves similarly to a black box would be the most secure option. Review section 5.4. **Resolved: 4/16/2020**
4. Mike: Consider any architectural alternatives to the current design to ensure that the best implementation is chosen. Review section 5.5. **Resolved: 4/18/2020**
5. Mike: In section 5.1, what does it mean where it says “the log will be an array”?  
  
As each command for cruise control comes in, we will append it to a file as opposed to maintaining an array. This is not to say the log will not be treated like an object as each message will be a tuple of a time stamp and a string which will be appended to the log file. **Resolved: 5/4/2020**
6. Mike: Do we want to keep in section 5.2 the general definition of components in software?  
  
Yes, we do want to keep it as it helps guide understanding of how we will be using components. **Resolved: 5/4/2020**
7. Connie: In section 5.3, we should add a `write_to_log()` function.  
  
We added another function to our Control Management Diagram in Section 5.3 that would write each command to the log. **Resolved: 5/4/2020**

8. Connie: In section 5.3, we should add some accessor functions in our control management diagram.

We added more functions to our Control Management Diagram in Section 5.3 that act as accessor methods. For example, we added: `getSpeed()`, and `isCruiseControlOn()` that return the current state of the vehicle. **Resolved: 5/4/2020**

9. Eric: In section 5.4, did we specify the specific programming language we will be using?

We were deciding between implementing the Cruise Control System in Java or C++. We ultimately decided to use Java because the group as a whole feels more comfortable programming in this language. **Resolved: 5/4/2020**

10. Eric: In section 5.4, why are we using a database for local cruise control?

Removal of the database as it will not be scalable so there is no reason to keep it. More so, since this is a local prototype and there is not a reason to connect the database. In order to store information, we have other means for it. It also leaves room for hackers to tamper with the software. **Resolved: 5/4/2020**

11. Hamzah: In section 5.4, there is a grammatical error in the first sentence of the last paragraph.

This grammatical error was corrected. **Resolved: 5/4/2020**

12. Hamzah: In section 5.6, we need to specify where the issues were in section 5.

The issues that were resolved in section 5.6 were updated to include the section where the issue was found. **Resolved: 5/4/2020**

13. Eric: The formatting of the charts in section 4.5 is off.

The diagrams in section 4.5 were reformatted to correct mistakes that were made when uploading the diagram to the document. This will make comprehension of the diagrams much easier. **Resolved: 5/4/2020**

14. Connie: There is a spelling error in section 4.1.

This spelling error was corrected. **Resolved: 5/4/2020**

    695 }

```

## 7 Tests

1.
  - (a) Description: User attempts to activate the Cruise Control System while the Cruise Control System is currently inactive.
  - (b) Expected Result: The Cruise Control System activates and provides visual feedback of activation.
  - (c) The user's car is already on and cruise control is not activated. The user is going above 25 miles per hour and the user attempts to push the "activate cruise control" button. Since the user is going at least 25 miles per hour, cruise control is now on and the user is free to set a cruise control speed if they would like.
  - (d) The user's car is already on and cruise control is not activated. The user is going below 25 miles per hour and the user attempts to push the "activate cruise control" button. Since the user is going below 25 miles per hour, cruise control is activated and the user now has an activated cruise control system.
  - (e) The user's car is not on and cruise control is not activated since the car is off. The user attempts to press the "activate cruise control" button and when the user does that, since the car is off, cruise control is not activated.
  - (f) The user's car is already on and cruise control is not activated. The user is going above 100 miles per hour and the user attempts to push the "activate cruise control" button, the cruise control system activates.
2.
  - (a) Description: User attempts to activate the Cruise Control System while the Cruise Control System is already activated.
  - (b) Expected Result: The Cruise Control System provides visual feedback that Cruise Control System is already activated. State of the Cruise Control System should not change.
  - (c) The user's car is already on and cruise control is already activated. The user is going above 25 miles per hour and the user attempts to push the "activate cruise control" button. When the user presses the "activate cruise control" button, nothing happens, and cruise control remains activated. The user has a joyous ride and nothing is broken.
  - (d) The user's car is already on and cruise control is already activated. The user is going below 25 miles per hour and the user attempts to

push the “activate cruise control” button. When the user presses the “activate cruise control” button, nothing happens, and cruise control remains activated. The user has a joyous ride and nothing is broken.

- (e) The user’s car is already on and cruise control is already activated. The user is going above 100 miles per hour and the user attempts to push the “activate cruise control” button. When the user does this, cruise control remains activated and nothing happens.
3. (a) Description: User attempts to set the Cruise Control Speed while the Cruise Control System is currently inactive.
    - (b) Expected Result: The Cruise Control System provides feedback that the Cruise Control System needs to be activated before setting the cruise control speed
    - (c) Cruise control is not activated and the car is turned on and the user is going at least 25 miles per hour but below 100 miles per hour. The user attempts to set the cruise control speed. When the user tries this, nothing happens and the user has no set cruise control speed because cruise control was not activated in the first place.
  4. (a) Description: User attempts to set the Cruise Control Speed while the Cruise Control System is currently active and current speed is less than 25.
    - (b) Expected Result: The Cruise Control System provides feedback that the current speed needs to be at least 25 miles per hour before setting the cruise control speed.
    - (c) Cruise control is not activated and the car is turned on and the user is going below 25 miles per hour. The user attempts to set the cruise control speed, but is unable to because the cruise control system is not activated.
  5. (a) Description: User attempts to set the Cruise Control Speed while the Cruise Control System is currently active and current speed is greater than 100 miles per hour.
    - (b) Expected Result: The Cruise Control System provides feedback that current speed needs to be less than 100 miles per hour in order to set the cruise control speed

- (c) Cruise control is not activated and the car is turned on and the user is going at least 100 miles per hour. The user attempts to set the cruise control speed, but is unable to because the cruise control system is not activated.
6. (a) Description: User attempts to set the Cruise Control Speed while the Cruise Control System is currently active and current speed is greater than 25.
- (b) Expected Result: The cruise control speed is set to the current speed and the Cruise Control System provides visual feedback that cruise control speed is now set to the current speed
  - (c) The user's car is on and the user is going at a speed that is greater than 25 miles per hour. The cruise control system is activated and the user attempts to set a cruise control speed. The user is successful and they set the cruise control speed and are able to increment and decrement the speed from a range of 25 miles per hour to 100 miles per hour.
  - (d) The user's car is on and the user is going at a speed that is greater than 100 miles per hour. The cruise control system is activated and the user attempts to set a cruise control speed. The user is unsuccessful because the user is going at least 100 miles per hour. They are not able to set a cruise control speed and continue to manually set the speed.
7. (a) Description: User attempts to increment the Cruise Control Speed while the Cruise Control Speed is not set
- (b) Expected Result: The Cruise Control System provides feedback that cruise control speed must be set before cruise control speed can be incremented
  - (c) The user's car is on and the cruise control system is activated. There is no set cruise control speed and the user is going greater than 25 miles per hour. The user then attempts to increment the cruise control speed but because there is no set cruise control speed, nothing happens.
  - (d) The user's car is on and the cruise control system is not activated. There is no set cruise control speed and the user is going greater than 25 miles per hour. The user then attempts to increment the cruise control speed but because there is no set cruise control

speed and the system is not activated, they cannot increment the speed.

- (e) The user's car is on and cruise control is activated. The user is going greater than 100 miles per hour and the user attempts to increment the cruise control speed. Since there is no set cruise control speed, the user cannot increment the cruise control speed. Nothing happens.
  - (f) The user's car is on and the cruise control system is not activated. There is no set cruise control speed and the user is going greater than 100 miles per hour. The user attempts to increment the cruise control speed but because there is no set cruise control speed, the user cannot increment the speed.
8. (a) Description: User attempts to increment the Cruise Control Speed while the Cruise Control Speed is currently 100 miles per hour
- (b) Expected Result: The Cruise Control System provides feedback that cruise control speed may not exceed 100 miles per hour
- (c) The user's car is on and the cruise control system is activated. The user successfully sets their cruise control speed to 100 miles per hour. The user is going 100 miles per hour and the user then attempts to increment the cruise control speed. They are not able to increment their cruise control speed so it remains at 100 miles per hour.
9. (a) Description: User attempts to increment the Cruise Control Speed while the Cruise Control Speed is less than 100 miles per hour and cruise control speed is different from current speed
- (b) Expected Result: The Cruise Control Speed is increased by one and the Cruise Control System provides visual feedback that the cruise control speed has been incremented by one
- (c) The user's car is on and the cruise control system is activated. The user is going at least 25 miles per hour (but is not going over 100 miles per hour). The user sets cruise control speed and successfully does it and then the user attempts to increase the speed by 1. The user is successful and the car's cruise control speed is incremented. The current speed of the car remains unchanged.
10. (a) Description: User attempts to increment the Cruise Control Speed while the Cruise Control Speed is less than 100 miles per hour and cruise control speed is the same as current speed

- (b) Expected Result: The Cruise Control Speed is increased by one and the Cruise Control System provides visual feedback that the cruise control speed has been incremented by one
  - (c) The user's car is on and the cruise control system is activated. The user is going at least 25 miles per hour (but is not going over 100 miles per hour). The user sets cruise control speed and successfully does it and then the user attempts to increase the speed by 1. The user is successful and the car's cruise control speed is incremented. The current speed of the car is also incremented by 1.
11. (a) Description: User attempts to decrement the Cruise Control Speed while the Cruise Control Speed is not set
- (b) Expected Result: The Cruise Control System provides feedback that cruise control speed must be set before cruise control speed can be decremented
  - (c) The user's car is on and the user is going over 100 miles per hour. The cruise control system is activated but there is no set cruise control speed. The user attempts to decrement the cruise control speed but nothing happens because the cruise control speed is not set. The user continues to go at their current speed.
  - (d) The user's car is on and the user is going at least 25 miles per hour. The cruise control system is activated, but there is no set cruise control speed. The user attempts to decrement the cruise control speed but nothing occurs because the cruise control speed is not set. The user continues on without decrementing their cruise control speed.
  - (e) The user's car is on and the user is going below 25 miles per hour. The cruise control system is activated, but there is no set cruise control speed. The user presses the decrement speed button but because there is no set cruise control speed, nothing
12. (a) Description: User attempts to decrement the Cruise Control Speed while the Cruise Control Speed is currently 25 miles per hour
- (b) Expected Result: The Cruise Control System provides feedback that cruise control speed may not go below 25 miles per hour
  - (c) The user's car is on and the user is going 25 miles per hour. The cruise control system is activated and the current cruise control speed is set to 25 miles per hour. The user attempts to press the

decrement speed button and the user continues to go at a cruise control speed of 25 miles per hour. The user cannot decrement the speed any lower.

13. (a) Description: User attempts to decrement the Cruise Control Speed while the Cruise Control Speed is greater than 25 miles per hour and cruise control speed is different from current speed.  
(b) Expected Result: The Cruise Control Speed is decreased by one and the Cruise Control System provides visual feedback that the cruise control speed has been decremented. Current speed should remain unchanged.  
(c) The user's car is on and the user is going 45 miles per hour. The cruise control system is activated and the current cruise control speed is set to 55 miles per hour. The user attempts to decrement the cruise control speed. The cruise control speed is decreased by 1 and the current speed remains unchanged.
14. (a) Description: User attempts to decrement the Cruise Control Speed while the Cruise Control Speed is greater than 25 miles per hour cruise control speed is the same as current speed.  
(b) Expected Result: The Cruise Control Speed is decreased by one and the Cruise Control System provides visual feedback that the cruise control speed has been decremented  
(c) The user's car is on and the user is going 45 miles per hour. The cruise control system is activated and the current cruise control speed is set to 45 miles per hour. The user attempts to decrement the cruise control speed. The cruise control speed is decreased by 1 and the current speed also decreases by one.
15. (a) Description: User increases speed of the car  
(b) Expected Result: The Cruise Control Speed remains the same while the current speed of the car increases to the user's desired speed  
(c) The user's car is on and the user is going 25 miles per hour. The cruise control system is activated and the current cruise control speed is set to 25 miles per hour. The user increases the current speed of the car to 35 miles per hour. The cruise control speed remains at 25 miles per hour.
16. (a) Description: User decreases speed of the car

- (b) Expected Result: The Cruise Control Speed remains the same while the current speed of the car decreases to the user's desired speed
  - (c) The user's car is on and the user is going 45 miles per hour. The cruise control system is activated and the current cruise control speed is set to 45 miles per hour. The user decreases the current speed of the car to 35 miles per hour. The cruise control speed remains at 45 miles per hour.
- 17. (a) Description: User stops the car using the brakes
  - (b) Expected Result: The Cruise Control speed is changed to zero and unset. The current speed of the car is set to 0. The cruise control system remains activated.
  - (c) The user's car is on and the user is going 45 miles per hour. The cruise control system is activated and the current cruise control speed is set to 45 miles per hour. The user uses the brakes to stop the car. The current speed of the car becomes 0 miles per hour. The cruise control speed is unset and the cruise control system remains activated.
- 18. (a) Description: User attempts to unset cruise control speed while cruise control speed is currently unset
  - (b) Expected Result: Cruise Control System should provide visual feedback that the cruise control speed is currently unset
  - (c) The user's car is on and the user is going 45 miles per hour. The cruise control system is activated but the current cruise control speed is not set. The user attempts to unset the cruise control speed. The cruise control system provides visual feedback that the speed is already unset.
- 19. (a) Description: User attempts to unset cruise control speed while cruise control speed is currently set
  - (b) Expected Result: The cruise control speed is unset and the Cruise Control System should provide visual feedback that the cruise control speed is now unset
  - (c) The user's car is on and the user is going 45 miles per hour. The cruise control system is activated and the current cruise control speed is set to 45 miles per hour. The user attempts to unset the cruise control speed. The cruise control speed is unset and

the cruise control system provides visual feedback that the cruise control speed has been unset.

20. (a) Description: User deactivates cruise control system when cruise control is activated
- (b) Expected Result: Cruise Control System unsets the cruise control speed if it is set and deactivates the cruise control system. The Cruise control System provides visual feedback of deactivation. Current speed of the car is not change
- (c) The user's car is on and the user is going 45 miles per hour. The cruise control system is activated and the current cruise control speed is set to 45 miles per hour. The user attempts to deactivate the cruise control system. The cruise control speed is unset and the cruise control system deactivates. Visual feedback that the cruise control system has been deactivated is provided.
21. (a) Description: User attempts to access the log with the wrong password
- (b) Expected Result: The Cruise Control System provides visual feedback that the password is incorrect
- (c) The user inputs a password that is incorrect to try to access the Cruise Control Log. The Cruise Control System provides feedback that that the password is incorrect and the Cruise Control Log is not opened
22. (a) Description: User attempts to access the log with the correct password
- (b) Expected Result: The cruise control System displays the log
- (c) The user inputs a password that is correct to try to access the Cruise Control Log. The Cruise Control System opens the Cruise Control Log. The log should contain all of the actions performed by the Cruise Control System.

## 8 Issues

1. Issue determining which Java GUI framework to use. **Resolved on 05/07/2020. Decided to use Java Swing due to its implementation relying on pure Java FX, which allows for greater portability. Furthermore, Java Swing has a greater support network that would enable faster remediations.**
2. Objects would not properly update in the GUI. **Resolved on 05/08/2020. Was an issue about how the objects were not declared in scope.**
3. Brake did not stop cruise control. **Resolved on 05/09/2020. Ensured that brake unsets cruise control yet keeps it activated so that the user can go back to enabling the cruise control by resetting the speed.**
4. Increment Cruise Control button incorrectly updated the engine speed instead of cruise control speed. **Resolved on 05/09/2020. Fixed the increment cruise control button to update the cruise control speed and not the engine speed.**
5. Able to set a cruise control speed before activation. **Resolved on 05/09/2020. Ensured that set cruise control can only be used as long as the cruise control system is activated by using a boolean flag.**
6. Log is not properly updated with all cruise control information. **Resolved on 05/10/2020. Ensured that after each cruise control activity the log is written with a BufferedWriter.**
7. Log has too much information by including all the activities that the car is doing. **Resolved on 05/10/2020. Remedied the issue by only allowing the log to be written when cruise control is activated.**
8. When accessing the admin logs in the GUI, if there is too much information in the window you cannot scroll down to view all of it. Need to implement scrolling functionality into the admin JFrame. **Resolved on 05/11/2020. Implemented a correct JScrollPane.**
9. When exiting out of the admin pane, the entire system shuts down. **Resolved on 05/11/2020. Deleted the call to System.exit**

when deleting out of admin pane and replaced it with a simple call to delete the frame and continue running cruise control.

10. Visual notifications for the program does not include changes in cruise control activation and deactivation. **Resolved on 05/11/2020. Extended the notifications to handle cruise control activation and deactivation.**
11. Scheduling conflicts due to Final Exam Week made team meetings less frequent then desired. **Resolved on 05/11/2020. Adopted a model where the group would meet for an hour every few days to discuss things to fix. Each individual member would then take a task and then fix it. On 05/11/2020, the group was able to devote several hours into refining the entire document and presentation.**
12. Brake functionality was not intended to set the EMS speed to 0, only unsetting the Cruise Control. **Resolved on 05/12/2020. Changed brake functionality so that it decrements EMS speed by 1, and unsets the cruise control.**
13. Upon admin accessing the log, not all actions were present thus giving the admin an outdated log. **Resolved on 05/12/2020. Changed admin action event so upon entering the correct password, the stream is flushed giving the admin the most up-to-date actions done by the user.**
